Long Fibre Reinforced Thermoplastics

January 2008 - July 2009

Rien van den Hondel

*i*Smithers

Please note: The Polymer Library is updated with hundreds of new records every two weeks and each Published Search is only compiled when an order is placed, ensuring that any new records matching your search criteria are included.

This is a sample Published Search containing a limited number of abstracts; there are just 44 records in this file, whereas full Published Searches contain around 300 records.

It is intended to give an idea of the layout and type of information you will receive, rather than volume.

This sample contains references to 'Long Fibre Reinforced Thermoplastics' which may not match your chosen title.

Introduction

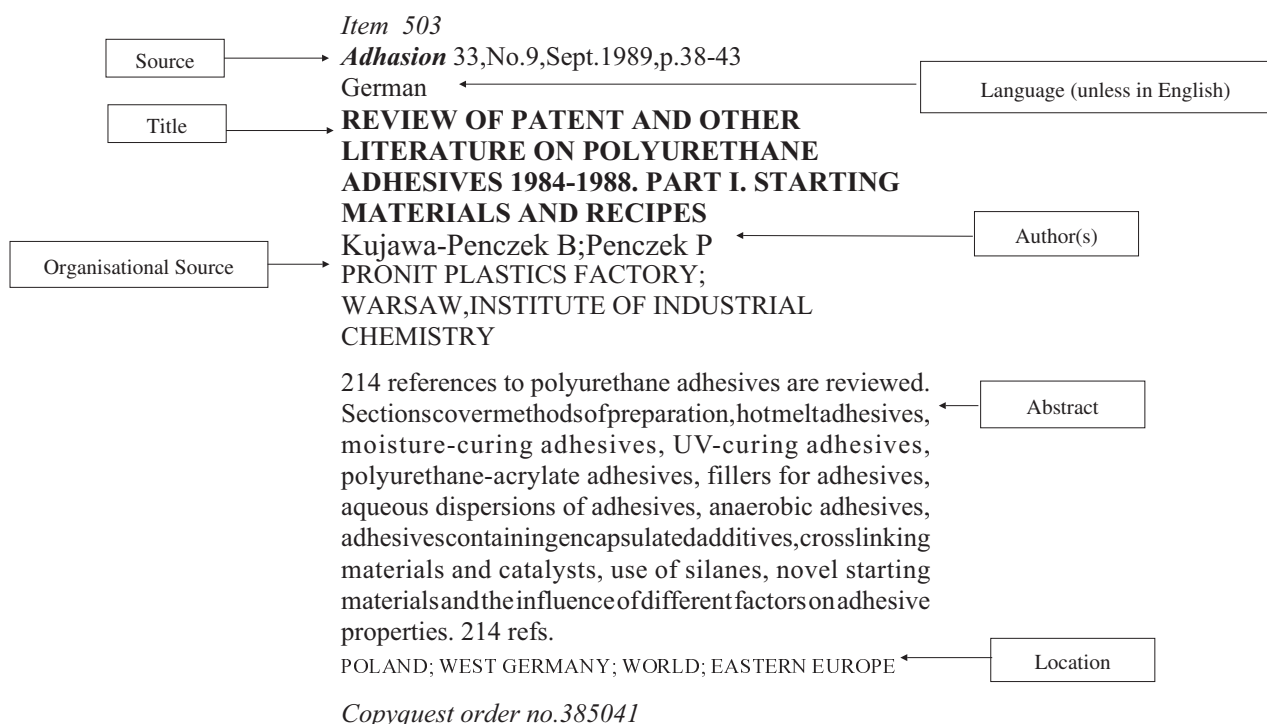

Published Searches are bibliographies produced by online literature searches in the Polymer Library database.

The Polymer Library covers technical, commercial and economic information for the Rubber and Plastics Industry. The database contains nearly 1,000,000 references (with abstracts) to journal articles, conference proceedings, reports, Company brochures, books etc., collected since 1972. Some patents were covered for periods during these years, but completely stopped in 2002. Each fortnight approximately 1000 new references are added to the database.

The SUBJECT INDEX gives an alphabetical listing of index terms. The NAME INDEX provides an alphabetical index to authors, companies, affiliations and trade names.

Any suggestions for improvement and/or future titles will be gratefully received.

REVOLUTION FOR LONG - FIBER THERMOPLASTICS (LFT).

Zimmerman D (Extruder Experts Systems)

Extruder Expert Systems' Nexxus-F, a new system for production of LFT pellets based on continuous fibre rovings, is briefly described. The system can be adapted to single- and twin-screw extruders and fibre length and fibre length distribution are precisely adjustable with control of the system. The system is suitable for use with polymers such as PP, PETP, polyamide-6,6 and ABS and with fibres such as glass, carbon, aramid and natural fibres. Experimental data on the mechanical properties of Nexxus LFT are included.

DAMPING BEHAVIOR OF LONG FIBER REINFORCED THERMOPLASTIC (LFT) COMPOSITES .

Goel A; Chawla K K; Vaidya U K

Pennsylvania, State University; Alabama, University at Birmingham

The damping behaviour of LFT (21 vol% E-glass fibre/PP) in flexural mode was studied. It was observed that the LFT beams in which the majority of fibres were oriented in the transverse direction showed more damping than the LFT beams in which the fibres were mostly oriented in the longitudinal direction. When the fibres were oriented transversely, the damping behaviour of LFT was dominated by the matrix and hence transverse LFTs showed higher damping as compared with the longitudinal LFT beams in which the fibres were oriented longitudinally and the damping behaviour was dominated by fibres which restricted the vibratory motion of the beam under flexural loading. The damping behaviour of LFT with cast iron and unreinforced PP was compared and it was found that LFTs spanned a range intermediate between the unreinforced PP and cast iron. 9 refs.

PROCESSING AND CHARACTERIZATION OF THIN-WALLED LONG FIBER REINFORCED THERMOPLASTIC (LFT) COMPOSITES .

Haibin Ning; Pillay S; Vaidya U; Andrews J B
Alabama, University at Birmingham

Thin-walled long fibre - reinforced thermoplastic (LFT) (carbon fibre- reinforced polyarylamide shells) that possessed enhanced rigidity and strength compared with glass reinforcement were manufactured and analysed. The extrusion-compression moulding process was used to produce 1.8 mm to 2 mm thick LFT composite shells. Fibre content and microstructure were investigated at different locations of the thin-walled shells and the results indicated good consolidation and uniform fibre flow during processing. Potential applications of thin-walled LFT technology are considered in areas where lightweight, high stiffness and strength are required in parts of relatively complex geometry, yet producible cost-effectively with short (less than 2 min) cycle times. 17 refs.

Brosius D

Despite the global slump in auto sales and ongoing financial crisis, the 2009 North American International Auto Show, held in January in Detroit, once again served as the leading showcase for production and concept vehicle introductions from domestic and international OEMs. The Automotive Composites Alliance sharpened its message about how composites can make hybrid vehicles lighter, thereby extending their range. AOC demonstrated extensions of its Tough Class A resin technology into lower-density exterior SMC panels. Standard TCA panels have a specific gravity of 1.9, but new formulations that replace heavy calcium carbonate filler with hollow glass microspheres or higher resin content can achieve a specific gravity of 1.3, offering mass savings of up to 50% versus steel. New applications for composites in mass-production vehicles on display included long fibre - reinforced thermoplastic front-end modules for the 2010 Ford Taurus and Ford Fusion.

Tucker C L (Pacific Northwest National Laboratory;
Oak Ridge National Laboratory; Illinois, University)

A model was proposed to predict the elastic-plastic response of injection-moulded long - fibre thermoplastics (LFTs). The model accounted for elastic fibre embedded in a thermoplastic resin that exhibited elastic-plastic behaviour obeying the Ramberg-Osgood relation and J-2 deformation theory of plasticity. It also accounted for fibre length and orientation distributions in the composite formed by the injection moulding process. Fibre orientation was predicted using an anisotropic rotary diffusion model recently developed for LFTs. An incremental procedure using Eshelby's equivalent inclusion method and the Mori-Tanaka assumption was applied to compute the overall stress increment resulting from an overall strain increment for an aligned-fibre composite that contained the same fibre volume fraction and length distribution as the actual composite. The incremental response of the latter was then obtained from the solution for the aligned-fibre composite by averaging overall fibre orientations. Failure during incremental loading was predicted using the Van Hattum-Bernardo model that was adapted to the composite elastic-plastic behaviour. The model was validated against the

experimental stress-strain results obtained for long-glass-fibre/PP specimens. 37 refs.

Pacific Northwest National Laboratory; Oak Ridge National Laboratory; Illinois University at Urbana-Champaign; Moldflow Ithaca

The application of a new fibre orientation model (ARD-RSC model) developed by Phelps and Tucker for long fibre thermoplastics is demonstrated. This model is implemented in a research version of the Moldflow processing packages and used in the injection moulding simulation of a long glass fibre/PP ISO-plaque. Fibre orientation distribution results from the simulation are mapped into an ABAQUS finite element mesh for structural analysis employing an elastic-plastic and strength prediction model developed by Nguyen et al. Predictions of failure locations are shown to agree well with experimental findings and confirm the importance of the fibre orientation effect on the overall response and occurrence of fracture. 14 refs.

PLASTICS ARE ON TRACK.

Wood or concrete has been the conventional choice for rail tracks sleepers for decades, but these materials could soon be replaced by PU. The process has been underway in Japan for some 25 years, with Sekisui Chemical supplying its Eslon Neo Lumber FFU (Fibre reinforced Foamed Urethane) product. Now the FFU sleepers have been premiered in Germany, in the Leverkusen Chempark. The installation

used 136 sleepers produced by Sekisui from a long fibre integral skin PU foam, Baydur 60, supplied by Sumika Bayer Urethane. PU is also finding applications between the sleepers. German rail engineering company Frenzel-Bau has teamed up with Bayer Material Science to develop Durflex, a new railway track ballast solution using Bayflex flexible PU foam to infill the cavities between the ballast stones. Meanwhile, safety requirements are the absolute priority for materials used inside rail cars and two new grades of BMS's Bayblend PC/ABS sheet meet these demanding criteria.

EFFECT OF FIBRE LENGTH ON THE FRICTION AND WEAR OF DISCONTINUOUS FIBRE REINFORCED POLYPROPYLENE MATERIAL.

Subramanian C; Senthilvelan S (Indian Institute of Technology)

The effect of fibre length on the tribological properties of glass fibre-reinforced PP composites under dry sliding was investigated using a pin-on-disc tribometer. Continuous measurement of friction force during testing revealed a transition from abrasive to adhesive friction. A dominance of PV factor over friction coefficient was observed. Long fibre-reinforced PP composites exhibited superior friction wear performance over short fibre reinforced PP composites and unreinforced PP and wear morphology confirmed that wear mechanisms were significantly altered by fibre length. 17 refs.

PROCESS SIMULATION, DESIGN AND MANUFACTURING OF A LONG FIBER THERMOPLASTIC COMPOSITE FOR MASS TRANSIT APPLICATION.

Balaji Thattai parthasarathy K; Pillay S; Ning H; Vaidya U K (Alabama, University)

Long fibre thermoplastics (LFTs) have witnessed rapid growth in thermoplastics matrix composites, mainly due to developments in the automotive and transportation sector. In LFTs, pelletised thermoplastic polymer matrix is reinforced with long glass or carbon fibres (3-25mm) are processed by extrusion-compression moulding. The current work focuses on the applied science and manufacturing of E-glass/polypropylene (E-glass/PP) LFT composite material. Process simulation was conducted to evaluate the flow of fibre filled viscous charge during the compression moulding of the LFT composite. Studies on optimum charge size and placement in the tool, press force, temperature of mould, shrinkage and warpage were also conducted. The flow pattern of the molten charge in the mould and the resulting fibre orientation predicted by process simulation are verified experimentally. The studies have been applied for a mass transit/transportation component namely, a LFT battery box access door for form-fit-function to replace a heavy metal door. Weight reduction of 60% was achieved using 40% weight percent E-glass/PP LFT over the metal design. 28 refs. Copyright (c) 2008 Elsevier Ltd.

EFFECT OF FIBER LENGTH AND COMPOSITION ON MECHANICAL PROPERTIES OF CARBON FIBER-REINFORCED POLYBENZOXAZINE.

Kumar K S S; Nair C P R; Ninan K N (Vikram Sarabhai Space Centre)

The mechanical strength and modulus of chopped carbon fibre (CF)- reinforced polybenzoxazine composites were investigated by changing the length of CFs. Tensile, compressive and flexural properties were investigated. The void content was found to be higher for the short fibre composites. With increase in fibre length, TS increased and was optimised at around 17 mm fibre length, whereas compressive strength exhibited a continuous diminution. The flexural strength also increased with fibre length and was optimised at around 17 mm fibre length. The increase in

strength of composites with fibre length was attributed to the enhancement in effective contact area of fibres with the matrix. The experimental results showed that there was about 350% increase in flexural strength and 470% increase in TS of the composites with respect to the neat polybenzoxazine, while compressive properties were adversely affected. The composites exhibited an optimum increase of about 800% in flexural modulus and 200% in tensile modulus. Enhancing the fibre length led to fibre entanglement in the composites, resulting in increased plastic deformation at higher strain. Multiple branch matrix shear, debonded fibres and voids were the failures visualised in the microscopic analyses. Defibrillation was exhibited by all composites irrespective of fibre length. Fibre debonding and breaking were associated with short fibres, whereas clustering and defibrillation were the major failure modes in long fibre composites. Increasing fibre loading improved the tensile and flexural properties up to 50-60 wt % of fibre, whereas the compressive properties consistently decreased with fibre loading. 31 refs.

TECHNOLOGY INNOVATIONS HELP SPUR MARKET.

Jung L; Renkl J (Krauss-Maffei GmbH)

Reaction process machinery (RPM) has grown in popularity as it enables processors to make lightweight parts with high flexural modulus on low-cost tooling. The process involves high-pressure mixing of two or more reactive liquid components for PUR, nylon, thermoset polyester or epoxy. A number of new technical developments have been developed by processing

equipment maker KraussMaffei including mixing heads, metering machines and production systems for PUR. One of these is the company's proprietary SkinForm process. SkinForm combines injection moulding with RPM in a single production system. The first step of the work cycle produces a thermoplastic substrate. In the second step, the substrate is partly or completely coated with PUR in the mould. KraussMaffei also offers a new In-Mould Painting process for producing long-fibre injection parts with high-gloss surfaces. A relatively new application is honeycomb-core moulding, where a cardboard honeycomb layer is sandwiched between two reinforced PUR layers. Another relatively new option is to combine the LFI process with In-Mould Graining.

BIOCOMPOSITES BY IN-LINE COMPOUNDING AND MOLDING.

At the Fraunhofer Institut für Chemische Technologie in Germany, scientists have been exploring new processes for manufacturing biocomposites of bio-based polymers and natural fibres such as hemp and flax. This small article offers us brief details of the researchers' adaptation of the D-LFT (direct long - fibre thermoplastic) technique for in-line compounding and moulding (previously used for glass fibre in standard resins such as PP).

FIBER LENGTH AND ORIENTATION IN LONG - FIBER INJECTION-MOLDED THERMOPLASTICS . I. MODELING OF MICROSTRUCTURE AND ELASTIC PROPERTIES.

Nguyen B N; Bapanapalli S K; Holbery J D; Smith M T; Kunc V; Frame B J; Phelps J H; Tucker C L (Pacific Northwest National Laboratory; Oak Ridge National Laboratory; Illinois, University)

A methodology was developed to predict the elastic properties of long-fibre injection-moulded thermoplastics (LFTs). The corrected experimental fibre length distribution and the predicted and experimental orientation distributions were used in modelling to compute the elastic properties of the composite. Firstly, the probability density functions were determined from the fibre length

distribution (FLD) data, in terms of number of fibres versus fibre length, and were used in the computation. The two-parameter Weibull's distribution was also used to represent the actual FLD. The Mori-Tanaka model that employed the Eshelby's equivalent inclusion method was then applied to calculate the stiffness matrix of the aligned fibre composite containing the established FLD. The stiffness of the actual as-formed composite was then determined from the stiffness of the computed aligned fibre composite that was averaged over all possible orientations using the orientation averaging method. The methodology to predict the elastic properties of LFTs was validated via experimental verification of the longitudinal and transverse moduli determined for long glass fibre injection-moulded PP specimens. Finally, a sensitivity analysis was conducted to determine the effect of a variation of FLD on the composite elastic properties. The analysis showed that it is essential to obtain an accurate fibre orientation distribution and a realistic fibre length distribution for accurate prediction of the composite properties. 30 refs.

IN THE FRAME.

Singh R (QinetiQ)

Current carbon fibre tennis racquet frames are manufactured by arranging ready-to-mould, pre-impregnated sheets of aligned, continuous fibre lengths and 0/90 degree weaves of fibre in a thermoset resin in different orientations and proportions so that the optimum balance in racquet properties can be achieved for a given frame shape and weight. However, this is labour intensive. Many advances in injection moulding and materials offer greater opportunities to mould larger and stronger components than were previously possible with short fibre composites. The benefits have arisen mainly from the development of discontinuous long - fibre reinforced moulding materials, containing fibre 10-15mm in length. QinetiQ, in collaboration with a major tennis racquet manufacturer, explored the possibility of using these types of materials for tennis racquet frames, with the aim of developing a competitive, low cost frame of comparable performance to existing composite versions.

JEC SHOWCASES INNOVATION.

Vink D

The JEC composites fair and conference attracted 1,053 exhibitors this year, up by 100 over 2007, and 27,000 visitors. The automotive industry was well represented, with Advanced Composites Group presenting use of the

carbon fibre prepreg system that is now supplied for bodywork of the Koenigsegg Automotive's Edition CCX and CCXR sports cars. Meanwhile, ACG launched its DForm Deformable Composite System at the show, combining conformability of short fibre moulding compound with the directional characteristics of high performance long fibre composites to make tooling systems. Gurit says its SPRINT car body sheet CFRP body panels are now used for the Aston Martin DBS model boot closure and lid, door opening surrounds, bonnet and front wing. PPhoneycomb core maker, Nidaplast says that its five families of GRP, metal, decorative stone, wood and reinforced PP facings that can be used with the Nidaplast 8 honeycomb panels are making a large contribution to lightweight building fa ade claddings.

RIISING TO THE DEMAND FOR LIGHTER AND STRONGER COMPOSITE MATERIALS.

Lydon M

Recent commercial developments in polymers, composites and foams to meet demands from the communications, diagnostics and aircraft sectors for lightweight high-strength products are reviewed. Examples cited include the production of long fibre - reinforced thermoplastic composites based on various resins such as polypropylene or polyamide for injection moulding applications, polyethylene fibres for medical device applications, and lightweight crosslinked closed-cell block poly(vinylidene fluoride) foams for aerospace applications. MECHANICAL PROPERTIES OF INJECTION MOLDED LONG FIBER POLYPROPYLENE COMPOSITES , PART 2: IMPACT AND FRACTURE TOUGHNESS.

Senthil Kumar K; Bhatnagar N; Ghosh A K (Indian Institute of Technology)

This study describes the effect of fibre length and compatibiliser content on notched izod impact and fracture toughness properties. Long fibre polypropylene (LFPP) pellets of different sizes were prepared by extrusion process using a new radial impregnation die, and subsequently, pellets were injection moulded as described in previous publication (ref.1). The content of glass fibre reinforcement was maintained same for all compositions. Maleic-anhydride grafted polypropylene (MA-g-PP) was chosen as a compatibiliser to increase the adhesion between glass fibre and PP matrix and its content was maintained at 2 wt%. Notched izod impact property was studied for LFPP composites prepared with and without compatibiliser for different pellet sizes. Failure mechanism due to sudden

impact was analyzed with scanning electron micrographs and was correlated with impact property of LFPP composites. Fracture and failure behaviour of injection moulded LFPP composite were studied and relationship between fracture toughness and microstructure of LFPP composite was analyzed. The microstructure of the composites was characterized by the dimensionless reinforcing effectiveness parameter, which accounts for the influence of fibre layer structure, fibre alignment, fibre volume fraction, fibre length distribution, and aspect ratio. Matrix stress condition factor and energy absorption ratio were determined for LFPP composites prepared with and without compatibiliser. Failure mechanism of both the matrix and fibre, revealed with SEM images, were discussed. 14 refs.

HERE'S THE SKINNY ON LONG FIBER .

Maniscalco M

Long - fibre thermoplastics (LFTs) solve some of the trickiest metal-replacement challenges at a cost lower than that of exotic, high-end polymers. In addition, unlike glass mat thermoplastics which support only compression moulding or stamping, long fibre enables the design freedom, parts consolidation and processing benefits of injection moulding. More recently added to the mix are inline compounding (ILC) systems for injection moulding, also known as D-LFT (direct long - fibre thermoplastic), which promise to reduce costs for high-volume production as they serve up stronger structural parts primarily in automotive applications. Townsend Polymer Services & Information predicts that the LFT global growth rate will remain around 12% annually through 2011. PP remains the dominant resin used for LFT, and automotive continues to account for the majority of end-use applications.

LFT DEVELOPMENT STATUS AND PERSPECTIVES.

Schemme M (Rosenheim, Fachhochschule)

Long fibre reinforced thermoplastics have become well established over the past 20 years as high performance engineering materials for structural applications in the automotive industry. Apart from their excellent economic benefits and low weight, their big advantage lies in a high level of productivity in processing, which is a result of the short cycle times attainable with thermoplastic matrix systems. This article reviews long fibre reinforced thermoplastics technologies and their applications in the automotive industry.

CLOSING THE GAP ON METALS.

Daykin S (DuPont Europe)

Recent developments in high-performance polymers and advanced reinforcing systems have allowed further use of engineering polymers as viable metal alternatives in demanding applications, but there is still a significant gap between strength and stiffness properties of engineering polymers compared with those of metals. Research and development of alternate technologies has explored materials solutions to further bridge this performance gap. DuPont has built a portfolio for Advanced Metals Replacement, which today includes two differentiated areas. SuperStructural Monolithic Solutions consists of an array of glass-, carbon- and long - fibre - reinforced thermoplastics for very high stiffness and strength combined with excellent resistance to creep and fatigue. New launches include high-stiffness carbon/glass-reinforced resins for Zytel HTN 51 and 53 series. The second addition is MetaFuse nanometal/polymer hybrids. MetaFuse uses a deposition process to apply a thin, ultra-high-strength metal layer to moulded components. A third, complementary solution is currently under development. Thermoplastic Composite Solutions foresees the overmoulding of a continuous-fibre reinforcement in a finished part to combine very high stiffness and strength with high part functionality and complexity.

MARKET CONDITIONS RIPE FOR HOT RUNNER ADVANCES.

Goldsberry C; Defosse M

One goal apparent in new hot runner designs is their manufacturers' charge to help mould makers reduce mould size, and save on mould costs (steel) and enable processors to use smaller processing machines. Speed-to-market also remains critical. Meeting these requirements is a mould/hot runner combination developed by mould maker Amtec and hot runner manufacturer Heitec. Their challenge was keeping costs low and mould size small for a mould for syringes with both Luer Lock and needle lock connections, so each can be fitted with different needles. D-M-E now offers a hot runner system especially for injection moulding of crates. It is the company's first hot runner system with a filter as standard. Filters are crucial in crate moulding as processors often mould with high recycle content and thus often high contaminant levels. New from Thermoplay is a hot runner system with the hot runner shut-off group integrated inside the nozzle(s) for moulders running stack moulds. Husky Injection Molding Systems is offering hot

runners aimed at preserving the fibre length for processors of long - fibre - reinforced compounds and a new option for the Ultra 500 valve gate that is able to withstand high pressure to mould, for example, electronics applications.

CLOSING THE GAP ON METALS.

Robertson C (DuPont Engineering Polymers)

Research and development in alternate technologies have explored materials solutions to further bridge the gap in material properties between metals and thermoplastics. It is against this background, particularly with regard to the discrepancy in terms of stiffness between its own engineering polymers and metals, that DuPont has built its own portfolio for Advanced Metals Replacement, which today includes two differentiated offerings. The company's SuperStructural Monolithic Solutions consists of an array of glass-, carbon- and long fibre-reinforced thermoplastics for very high stiffness and strength combined with excellent creep and fatigue resistance. New launches include high-stiffness carbon/glass reinforced resins for the DuPont Zytel HTN 51 and 53 series, whereby tensile modulus, or stiffness, has been increased by 50% or more versus its existing glass fibre- reinforced grades. The second, most recent addition to the DuPont portfolio of advanced metal replacements are Metafuse nanometal/polymer hybrids. The new technology employs a proprietary process that precisely applies ultra high-strength nanometal to components made of DuPont engineering polymers to create lightweight components in myriad, complex shapes with the stiffness of magnesium or aluminium and higher strength.

ADDITIVES ADD KEY INNOVATIONS.

Snyder M R

In the composites industry, the category "additives" describes a variety of materials that have in common the

ability to modify the behaviour, appearance, mechanical properties and/or processability of a polymer resin. This article examines additives developments that have added value to these indispensable resin system add-ons. PlastiComp has introduced its line of Complet pellets in which long fibre - reinforced thermoplastic technology is compounded with impact modifiers, colourants and other customer-specified additives. It is claimed that the materials have found to be superior to dry-blended materials in terms of part-weight consistency and aesthetics. RTP has enhanced its line of long fibre thermoplastic compounds with the introduction of long-cut additive pellets, produced in master batches to reduce customer lead time. Material separation during handling reportedly is minimised because the pellet geometry of the additives is similar to the LFT pellets. Cloisite nanoclay additives from Southern Clay Products can be incorporated into material formulations for SMC and BMC to improve resin flow and, therefore, finished part quality.

**LFT DEVELOPMENT STATUS AND
PERSPECTIVES.**

Schemme M (Rosenheim F.H.)

Apart from their excellent economic benefits and low weight, the big advantage of long fibre reinforced thermoplastics lies in a high level of productivity in processing, which is a result of the short cycle times attainable with thermoplastic matrix systems. With the arrival of new material systems optimised for the specific application, and with the ongoing development of the processing and process engineering, it has now become possible to mass produce highly stressed structural parts and innovative module systems with a high level of functional integration. Current examples of applications in the automotive segment include instrument panel supports, technical front-ends, door and roof modules, hatchback doors, seat shells, bumper supports, sound-absorbing shells, spare wheel pans and complete underbody systems. A real reduction in the weight of vehicles can only be reached by the use of new material concepts and manufacturing technologies. Glass fibre/PP based LFT materials meet the demands of the automotive industry regarding system costs and mass production because of their competitive prices and the cycle times which can be realised with thermoplastic matrices.

GLOBAL LFT MARKET IS SET FOR 12%

GROWTH.

A 12% global growth rate for long fibre - reinforced thermoplastics is predicted up to 2011, according to the Global LFT Market report compiled by Townsend Polymer Services & Information. The report predicts that by 2011, an extra 400m US dollars in revenue from LFT will have been created. Growth is largely being driven by automotive producers using LFT to replace metal components to reduce the weight of their vehicles and therefore fuel consumption. Half of the LFT volume increase forecast over the next five years is put down to five application areas including: front-end modules, instrument panels, door modules and underbody shields in automotive and general/industrial goods in the non automotive sector. In 2006, China accounted for only 5% of the total worldwide LFT consumption, ranking it fourth behind Europe, North America and Japan. By 2011, however, China is expected to surpass Japan, which currently uses 11% of the world's LFT, it is briefly reported.

Polymer Library Document Delivery Service

All documents which are cited in your Published Search are available from us as copyright cleared photocopies, via our document delivery service.

How to Order

Orders can be placed by post, telephone, fax, or e-mail (see contact details below). All we need to know is:

- your name and address
- which documents you require (**Copyquest order number** or full bibliographic details)
- credit card details or your annual deposit account number (see below).
- please also specify how you want us to deliver the document (E-mail/Fax/Post).

Documents are usually despatched from Smithers Rapra within 24 hours from receipt of request (Monday - Friday) using first class mail within the UK, and airmail for the rest of the world. If you request e-mail service, delivery could be within hours anywhere in the world. Some items can even be downloaded instantly in pdf format.

Annual Deposit Accounts

Customers may open a deposit account for the use of our Document Delivery Services whereby the account is debited for each request supplied. The minimum deposit is £99 and documents are deducted from this amount at the rate of £7.50 per document + copyright fee (if applicable), except pdf files which are priced individually (at publisher's discretion) and patents which are always £11. Deposit accounts are valid for 12 months.

Document Delivery Prices 2009

For customers who do not have a deposit account, all documents are £11 each + copyright fee (+VAT in the UK), except pdf files which are priced individually (at publisher's discretion) and patents which are always £13. These are payable by **credit card only**. (Prices are per copy, regardless of length)

If a pdf file is available, we can only deliver the document at the price quoted on www.polymerlibrary.com

If the combined copyright and handling charge for one document is in excess of £20 we will contact you for authorisation before proceeding with your order. For amounts under £20 we will fulfil the order without further contact.

(VAT will normally only be added to UK orders. However customers in all other EC countries are required to supply their VAT registration number if VAT is not to be charged)

For more information or to place an order please contact the Document Delivery Department:

157. Liquid Silicone Elastomers
156. Polymers in Fuel Cells
155. Recycling of Scrap Tyres
154. PVC in Medical Applications
153. Nanocomposites
152. Rapid Prototyping
151. Fast Mould Making
150. Thin Wall Injection Moulding
149. Powder Injection Moulding
148. Polymer Polyols
147. Medical Applications of Thermoplastic Elastomers
146. Latex Allergies
145. Market Data on Scrap Tyres
144. Electrical Cables
143. Cable Applications of Thermoplastic Elastomers
142. Market Data on Scrap Tyres
141. Automotive Applications of Nylon/Polyamide
140. Under-the-bonnet Applications
139. Repairing of Composites
138. Volatile Organic Compound (VOC) Emissions
137. Legislation on Emissions
136. Legislation on Plastics Waste
135. Adhesives and Sealants for Engineering Applications
134. Adhesives and Sealants for Aerospace Applications
133. Adhesives and Sealants for Electronic Applications
132. Pressure Sensitive Adhesive Tapes
131. Tackifiers
130. Bonding of Wood
129. Flexible Polyurethane Foams
128. Mechanical Properties of Adhesive Joints
127. Nitrosamines in the Rubber Industry
126. Polyurethane Foams used in Automotive Applications
125. Automotive Applications of Polyurethane Elastomers
124. Properties of Polyurethane Coatings
123. Testing of Polyurethane Elastomers
122. Catalysts used in the Polyurethane Industry
121. CFC-Free Blowing Agents for Polyurethanes
120. Toxicity Issues in the Polyurethane Industry
119. Reinforced Reaction Injection Moulding of Polyurethane
118. Reaction Injection Moulding of Polyurethane
117. Structural Polyurethane Foams
116. Cast Polyurethane Elastomers
115. Polyurethane Insulation
114. Polyurethane Adhesives
113. Polyurethanes used in Sport and Recreational Applications

112. Textile Applications of Polyurethanes
111. Polyurethanes used in Packaging
110. Medical & Surgical Applications of Polyurethanes
109. Polyurethanes used in Furniture
108. Polyurethanes used in Footwear
107. Electrical Applications of Polyurethanes
106. Construction Applications of Polyurethanes
105. Health and Safety Issues relating to Isocyanates
104. Disposal of Polyurethanes
103. Recycling of Polyurethanes
102. Market Data on Polypropylene
101. Market Data on PVC
100. Liquid Crystal Polymers in Electronic Applications
99. Flame Retardants
98. Agricultural and Horticultural Applications of Plastics
97. Thermoplastic Elastomers in Automotive Applications
96. Mineral Fillers
95. Manufacturers of Injection Moulding Machinery
94. Food Packaging Legislation
93. Biodegradable Polymers for Medical Applications (see also PS19)
92. Starch-based Degradable Polymers (see also PS19)
91. Composites in the Railway Industry
90. Electron Beam Irradiation
89. Pressure Sensitive Acrylics
88. Miscibility of PVC Blends
87. Epoxy Resins in Aerospace Applications
86. Pumps
85. Market Data on the use of Polymers in Automotive Applications
84. Market Data for Acrylonitrile Butadiene Styrene (ABS)
83. Market Data for Composites
82. Market Data for Polyethylene Terephthalate (PETP)
81. Market Data for Polyamides
80. Plasticisers
79. Granulators (Machinery)
78. Microcellular Polymers
77. Machining of Reinforced Plastics
76. Impact Modifiers
75. Sheet Moulding Compounds
74. Optical Fibres
73. Vacuum Bag Moulding
72. Gas Injection Moulding
71. Microwave Vulcanisation
70. Long Fibre Reinforced Thermoplastics
69. Structural Reaction Injection Moulding
68. Hoses for Automotive Applications
67. Blister Packaging
66. Tamper Evident Packaging
65. Structural Foam Moulding
64. UV Curable Adhesives
63. Sports Equipment
62. Sports Surfacing
61. Car Bumpers

60. Blends with PMMA
59. Blends with Polyethylene
58. Blends with ABS
57. Toxicity of Reinforcing Agents and Fillers (excl. Asbestos)
56. Toxicity of Curing Agents and Accelerators
55. Toxicity of Flame Retardants, Stabilisers and Antioxidants
54. Toxicity of Plasticisers
53. Toxicity of Solvents
52. Acetal Copolymers
- 51a. Recycling of Plastics (Packaging)
- 51b. Recycling of Plastics (Non-Packaging)
50. Extrusion Blow Moulding
49. Environmental Stress Cracking (Crazing) of Plastics
48. Urea Formaldehyde in Building Materials
47. Elastomeric Foam
46. Hybrid Composites
45. Computer Integrated Manufacturing and Computer Aided Manufacturing (CIM/CAM) for the Polymer Industries
44. Electromagnetic Interference (EMI) Shielding Polymers
43. Flash Removal (Machinery, Methods, Automation, etc.)
42. O-rings (Properties, Testing, Design, Materials, etc.)
41. Resin Transfer Moulding (Resin Injection Moulding)
40. Statistical Process Control (SPC) for the Polymer Industries
39. V-belts
38. SPIRO Polymers
37. Polyphenylene Sulphide (PPS)
36. Phenolic Foam
35. Extruder Dies
34. Antistatic Agents
33. Mould Fouling and Mould Cleaning
32. Rotational Moulding (Processes and Equipment)
31. Mould Cooling
30. uPVC (Rigid PVC)
29. Extrusion of PVC (Processes and Equipment)
28. Shrink Packaging
27. Piezoelectric Properties of Polymers
26. Coupling Agents
25. Non-Destructive Testing
24. Polymer Concrete
23. Polymers in Dental Applications
22. Graphite Fibre Reinforced Epoxy Composites
21. Ion Exchange Resins
20. Ultrasonic Welding of Polymers
19. Biodegradable Polymers (excl. starch-based materials and medical applications (see also PS92 and PS93))
18. Plastic Pipes and Fittings for Drinking Water
17. Continuous Vulcanisation
16. Blends with EPDM
15. Plastic Lenses (including Contact Lenses)
14. Twin Screw Extruders - Extrusion
13. Barrier Packaging in Food Applications
12. Polymers for Controlled Release Systems

11. Filament Winding for Composites
10. PVC Plasticsols
9. Chlorosulphonated Polyethylene
8. Water Vapour Permeability of Polymers
7. Mould Release Agents for Plastics and Rubber
6. Ultra High Molecular Weight Polyethylene
5. Polyethylene Terephthalate Bottles
4. Flame Retardant Polymeric Foams (excl. Polyurethane)
3. Flame Retardant Polyurethane Foams
2. Asbestos Substitutes
1. Blowing Agents for Polymeric Foam

Price per publication £99

Request Form for a Customised Search

Customised literature searches on specific areas of interest can be produced from the Polymer Library database. Such a literature search consists of a list of references relevant to the topic and include a short abstract. Full copies of the most relevant articles can subsequently be ordered from us. The 2009 price for a literature search based on the Polymer Library is £250 plus VAT.

1. Please describe your interest in detail.

2. If you are already aware of any relevant articles, please quote title, author, journal name and date.

3. How far back in time would you like us to search? (Our database starts from 1972)

4. Would you like non-English language references included? YES/NO
5. Would you like commercial information included? YES/NO
6. Would you like the results of your search limited to the 100 most recent references, assuming that there are that many references for your query? (an additional charge of 60 pence for each reference in excess of 100 will be made) YES/NO
7. Would you like suggestions and quotations for searches in other databases in addition to the our own database? (e.g. Chemical Abstracts, World Patents Index etc.). . . YES/NO
